What it does:

As there is a shortage of many things like masks, medicines, food, etc. Our web application helps in making requests for required items by hospitals/NGO. Donors can see their requests and can parcel required things to the needed hospital/NGO.

Quarantine is a must for people nowadays but people are coming outside to buy their daily usage things like milk, etc. So we also included a feature in which a QR code is generated and a person can scan the QR code of another person. It is like a virtual handshake which results in formation of a chain. If any person gets infected then an alert can be sent to other people to quarantine themselves.

How we built it:

We built it using **ReactJS and Firebase. Google Maps API** was used for displaying maps. React libraries were used for UI, QR Code, Firebase and Bootstrap. The website is hosted on **Heroku**.
